Tax Heterogeneity, Duration Risk, and the Term Structure: An Application to the Municipal Bond Puzzle [Link to Paper] [SSRN]

Abstract: I develop a term-structure model in which investors with heterogeneous taxes and balance sheets choose taxable and tax-exempt bonds jointly across maturities under short-sale constraints. Taxes and risk-bearing capacity endogenously segment bond ownership, making the tax rate embedded in yields vary with maturity. The literature benchmarks tax-exempt municipal bond yields against the after-tax taxable bond yields of top-bracket households, the highest-tax investors. The model explains the municipal bond puzzle: short-term municipal yields closely match this benchmark, but thirty-year yields exceed it by 118 basis points. Lower-tax investors with liabilities that offset interest-rate risk bear duration risk more cheaply, so they hold long

municipal bonds and long yields reflect their lower taxes. Without targeting municipal yields, the calibrated model explains 83 percent of this gap. Empirical tests confirm the model's prediction that household tax effects weaken with maturity while those of lower-tax investors strengthen.

The Effects of Generative AI on High-Skilled Work: Evidence from Three Field Experiments with Software Developers *with Mert Demirer, Sonia Jaffe, Leon Musolff, Sida Peng, Tobias Salz.* [Link to Paper]

Coverage: *New York Times, 2025 Economic Report of the President*
***Management Science*, Forthcoming**

Abstract: This study evaluates the effect of generative AI on software developer productivity via randomized controlled trials at Microsoft, Accenture, and an anonymous Fortune 100 company. These field experiments, run by the companies as part of their ordinary course of business, provided a random subset of developers with access to an AI-based coding assistant suggesting intelligent code completions. Though each experiment is noisy and results vary across experiments, when data is combined across three experiments and 4,867 developers, our analysis reveals a 26.08% increase (SE: 10.3%) in completed tasks among developers using the AI tool. Notably, less experienced developers had higher adoption rates and greater productivity gains.

Working Papers

Familiarity in International Equity Investment: Concentrated Value, Pervasive Allocation Bias *with Yinan Qiu. [Link to Paper]*

Abstract: Does familiarity convey information or produce bias? Using 2000–2024 data from 1,663 active U.S. international equity funds and managers' foreign education as a familiarity proxy, we examine both country allocation and stock selection. Funds overweight education-linked countries, yet these sub-portfolios do not outperform. Within familiar countries, the most active quartile of stocks earns a monthly five-factor alpha of 41 basis points, while the remaining holdings earn no significant alpha. The overweight persists after removing top-quartile stocks. Familiarity's value is concentrated, its allocation footprint pervasive: information and bias coexist at margins that country-level averages obscure.

Public Debt Resolution and the Relocation of Local Information Rents: Evidence from Bank Wealth-Management Products in China *with Tao Shen, Tianqi Zhi.*
Draft available upon request

Abstract: China's 2023 program to defuse local government debt risk had an unintended cost for small local banks, which compete with national banks in the RMB 30 trillion wealth-management market through local credit. Their products hold three times the portfolio share of local government financing vehicle (LGFV) bonds that national banks' products do, mostly from their home provinces, and these holdings deliver the higher returns and fewer losses that attract return-chasing investors. By moving LGFV risk onto provincial balance sheets, the program compressed credit spreads within and across provinces. The premium on home-province bonds fell by two-thirds, and local banks retreated. The premium largely survived in non-standard debt, negotiated claims with no public price, but only the largest local banks had the scale to move into it. De-risking public bonds relocated the return to local information into opaque claims that require scale, and the smallest banks lost most.

Work in Progress

The Limits of Debt Discipline: Risk-Based Regulation and Shadow Finance *with Tao Shen, Wei Xiong, Tianqi Zhi.*

Abstract: China's local debt policies show that risk-based regulation can redistribute financing pressure rather than resolve it: borrowing moves across regions and into costly shadow finance, and expected relief may invite moral hazard. The central government restricts borrowing in high- risk regions and later gives them priority for debt relief. Historically aggressive regions face tighter financing and grow more slowly afterward, while debt keeps accumulating in fiscally stronger regions despite weak cash returns on investment. Rating-based bond restrictions also push borrowers toward expensive nonstandard debt from trusts and leasing companies. After the 2023 debt-resolution program, which favored risky regions, bond costs fall without comparable easing in nonstandard financing: the same borrower's nonstandard premium over its bonds widens by 176 basis points. Yet regions that received less relief, and were seen as less risky, keep expanding into this costly debt, as expected future relief would encourage. Debt discipline thus has a limit: calmer targeted markets can coexist with weaker regional development and persistent expensive borrowing, while the commitments behind that borrowing remain unresolved.
