Tax Heterogeneity, Duration Risk, and the Term Structure: An Application to the Municipal Bond Puzzle [Link to Paper] [SSRN]

Abstract: I develop a term-structure model in which investors with heterogeneous taxes and balance sheets choose taxable and tax-exempt bonds jointly across maturities under short-sale constraints. Taxes and risk-bearing capacity endogenously segment bond ownership, making the tax rate embedded in yields vary with maturity. The literature benchmarks tax-exempt municipal bond yields against the after-tax taxable bond yields of top-bracket households, the highest-tax investors. The model explains the municipal bond puzzle: short-term municipal yields closely match this benchmark, but thirty-year yields exceed it by 118 basis points. Lower-tax investors with liabilities that offset interest-rate risk bear duration risk more cheaply, so they hold long

municipal bonds and long yields reflect their lower taxes. Without targeting municipal yields, the calibrated model explains 83 percent of this gap. Empirical tests confirm the model's prediction that household tax effects weaken with maturity while those of lower-tax investors strengthen.

The Effects of Generative AI on High-Skilled Work: Evidence from Three Field Experiments with Software Developers *with Mert Demirer, Sonia Jaffe, Leon Musolff, Sida Peng, Tobias Salz.* [Link to Paper]

Coverage: *New York Times, 2025 Economic Report of the President*
***Management Science*, Forthcoming**

Abstract: This study evaluates the effect of generative AI on software developer productivity via randomized controlled trials at Microsoft, Accenture, and an anonymous Fortune 100 company. These field experiments, run by the companies as part of their ordinary course of business, provided a random subset of developers with access to an AI-based coding assistant suggesting intelligent code completions. Though each experiment is noisy and results vary across experiments, when data is combined across three experiments and 4,867 developers, our analysis reveals a 26.08% increase (SE: 10.3%) in completed tasks among developers using the AI tool. Notably, less experienced developers had higher adoption rates and greater productivity gains.

Working Papers

Familiarity in International Equity Investment: Concentrated Value, Pervasive Allocation Bias *with Yinan Qiu. [Link to Paper]*

Abstract: Does familiarity convey information or produce bias? Using 2000–2024 data from 1,663 active U.S. international equity funds and managers' foreign education as a familiarity proxy, we examine both country allocation and stock selection. Funds overweight education-linked countries, yet these sub-portfolios do not outperform. Within familiar countries, the most active quartile of stocks earns a monthly five-factor alpha of 41 basis points, while the remaining holdings earn no significant alpha. The overweight persists after removing top-quartile stocks. Familiarity's value is concentrated, its allocation footprint pervasive: information and bias coexist at margins that country-level averages obscure.

How Hidden Local Government Debt Shapes Shadow Banking Competition: Evidence from Wealth Management in China *with Tao Shen, Tianqi Zhi. [Link to Paper]*

Abstract: Using granular holdings data on China's RMB 33 trillion wealth-management market, we study how government support for borrowers shapes competition in shadow banking. Smaller banks sought to gain an edge over larger rivals by reaching for yield in bonds issued by local government financing vehicles (LGFVs) in their home provinces. The 2023 debt resolution initiative reinforced expectations of support for LGFVs and reduced their bond credit spreads, thereby reshaping shadow banking activity. The extra return from home-province LGFV bonds fell by 69%. Larger local banks replaced part of the lost yield with riskier, privately negotiated LGFV-linked credit, an opaque form of financing that requires scale to arrange. Smaller banks replaced little of the lost yield, and their product returns and wealth-management balances subsequently fell relative to those of larger banks. Government support for borrowers can thus erode smaller banks' competitive edge and shift shadow banking toward larger intermediaries and more opaque credit.

Work in Progress

The Limits of Debt Discipline: Risk-Based Regulation and Shadow Finance *with Tao Shen, Wei Xiong, Tianqi Zhi.*

Abstract: We study how risk-based limits on public borrowing move credit risk into costlier, less visible corners of local finance. China restricts borrowing by local government financing vehicles (LGFVs) in regions it rates as high risk and later gives those regions priority for debt relief. With the infrastructure and development projects behind this borrowing still under way, we find that financing pressure shifts rather than disappears. Regions that borrowed aggressively in the past face tighter financing and later suffer from slower growth, while debt accumulates instead in regions perceived as fiscally stronger, despite weak investment returns. LGFVs facing rating-based limits on bond issuance turn to more costly shadow finance, borrowing nonstandard debt from trusts and leasing companies. The 2023 debt-resolution program, which used special government bonds to refinance LGFV debt mostly in the riskiest regions, lowered bond credit risk but left nonstandard debt risky. For the same borrower, the gap between nonstandard and bond rates widened by 176 basis points. Because relief goes to the riskiest regions, it also invites moral hazard, as regions that received less of it and were seen as less risky keep expanding into this costly nonstandard debt.
